SETUP GUIDE

# rahhh

## Twitch Bot Control Panel

Everything you need to connect your Twitch accounts, start the bot, and turn on whichever optional features you want: Spotify song requests, OBS overlays, the Wordle chat game, Daily Check-In, custom commands, and more.

Song Requests · Wordle · Daily Check-In · Coin Toss · Clips · Custom Commands

Start with Section 1, even if you only care about one feature: the Twitch connection is required for everything else.

CONTENTS

# What's in this guide

01 **Before You Start** — Required
What you'll need on hand before opening the app

02 **Connecting Twitch** — Required
Streamer, Bot, and Mod accounts

03 **Starting the Bot** — Required
A separate step from connecting accounts

04 **Spotify & Song Requests** — Optional
!sr, channel points, playlist auto-add, Now Playing overlay

05 **OBS Overlays** — Optional
SFX, Now Playing, and Wordle browser sources

06 **Wordle Game** — Optional
Chat-driven Wordle with a leaderboard

07 **Daily Check-In** — Optional
A channel-points redeem that awards points, sent from your own account

08 **Custom Commands** — Optional
Build your own !commands, no code required

09 **Channel Point Redeems** — Optional
Create and manage rewards directly from the app

10 **Coin Toss** — Optional
Zero-config chat minigame, nothing to set up

11 **Troubleshooting** — Handy
The mistakes almost everyone makes once

SECTION 01

# 📋 Before You Start

A five-minute checklist before you open the app for the first time.

✅ **You'll always need:** a free Twitch account to register a Developer app with (this can be your streaming account or a separate one; you'll paste its Client ID/Secret into the app, nothing gets uploaded anywhere else).

🎵 **Only if you want Song Requests:** a free Spotify Developer app, and Spotify Premium on the account you connect (the Spotify Web API's playback controls, like queueing and skipping, require Premium).

## How this app is organized

The sidebar has one page per feature: **Dashboard**, **Wordle**, **Lists**, **Clips**, **Daily Check In**, **Song Requests**, **Commands**, **Redeems**, and **Settings**. Everything under Settings is required. Everything else is optional and only does anything once you turn it on.

## The general shape of setup

1. Connect your Twitch accounts in **Settings** (Section 2).
2. Press **Start Bot** on the **Dashboard** (Section 3); this is a separate step people often miss.
3. Turn on whichever optional features you actually want. Everything else can stay off forever with zero downside.

SECTION 02 · REQUIRED

# Connecting Twitch

Everything lives on the **Settings** page. This is the only section every single user has to do, regardless of which optional features they want.

## Why three separate Twitch accounts?

The app connects to **three** Twitch logins, each doing a distinct job:

**Streamer Account**

Sets the `Target Channel` the bot operates in, and sends official shoutouts.

**Bot Account**

The login the bot actually chats as. Can be a dedicated bot account, or the same login as your Streamer account if you don't have one.

**Mod Account**

Used only for creating/downloading clips. Sets `Moderator Login`.

All three can be the exact same Twitch login if you don't have separate accounts. The app doesn't require them to differ, it just supports it if you do.

## Step-by-step

1. Open the **Settings** page and find the **Twitch App** section.
2. Click **Open Twitch Developer Console**, sign in, and register a new application.
3. In your new Twitch app's settings, add this exact URL to **OAuth Redirect URLs**:

   `http://localhost:17846/callback`

   The app also shows this value next to a **Copy** button. Use that instead of retyping it, since one wrong character here is the #1 cause of "Connect" not working.
4. Copy your new app's **Client ID** and **Client Secret** back into the matching fields in Settings.
5. Click **Connect with Twitch** under **Streamer Account**, approve access in the browser window that opens, and confirm the login. Repeat for **Bot Account** and **Mod Account**.

⚠️ **Redirect URI must match exactly.** Twitch's console is picky about trailing slashes and http vs https. If a Connect button seems to hang or silently fail, this is almost always why. Go double-check it against the Copy button's value.

💡 Each Connect button forces Twitch's account picker to show up (`force_verify`), even if you're already logged into Twitch in your browser, so you can safely connect three different logins one after another without having to log out in between.

Access/Refresh tokens for each account are shown (password-hidden, with a Show toggle) and refresh themselves automatically from then on. You only go through this flow again if you disconnect or a token gets

revoked.

SECTION 03 · REQUIRED

# Starting the Bot

This trips up almost everyone once: connecting your Twitch accounts does **not** start the bot.

## Go to the Dashboard

Once all three Twitch accounts are connected, head to **Dashboard** and click the big `Start Bot` button. This launches the actual bot process (chat listening, EventSub subscriptions, everything) as a separate step from just having your accounts connected.

> ⚠️ **Relaunching the whole app is not the same as restarting the bot.** If the app itself restarts (you closed and reopened it, or it auto-updated), the bot does *not* come back on its own. You have to press Start Bot again.

## When do I need to restart the bot?

As a rule of thumb:

- **Always** after changing anything on the Settings page. The `Save & Restart Bot` button there handles this for you automatically.
- **Usually not** for most other pages (Song Requests, Wordle, Daily Check-In, Commands). Those settings are picked up live or the next time they're relevant. If something you just changed doesn't seem to take effect, a quick Stop → Start on the Dashboard always resolves it.

SECTION 04 · OPTIONAL

# Spotify & Song Requests

Lets viewers request songs by chat command or channel points, with an optional live Now Playing overlay for OBS.

## Connect Spotify

On the **Song Requests** page, find the **Spotify Connection** section:

1. Click **Open Spotify Developer Dashboard** and create an app.
2. Add this exact redirect URI to your Spotify app's settings:
   `http://127.0.0.1:17845/callback`
3. Paste your Spotify app's Client ID and Client Secret into the matching fields, then click **Connect Spotify**.

⚠️ **Spotify's redirect URI uses `127.0.0.1`, not `localhost`**: the opposite convention from the Twitch one in Section 2. Spotify's own console rejects plain `localhost`, so this isn't a typo.

🎧 The connected Spotify account needs **Premium**: queueing, skipping, and playlist edits all go through Spotify's playback-control API, which free accounts can't use.

## Turn on requests

Under **Request Behavior**, enable either or both:

- **Chat command**: defaults to `!sr`, editable.
- **Channel points redeem**: pick an existing Twitch reward from the dropdown (create it on Twitch itself, or on this app's **Redeems** page, first).

From there you can set a per-user cooldown, a max song length, how many seconds before a track ends the next request gets pushed into Spotify's queue, how many upcoming songs `!queue` shows by default, who's allowed to use the chat command (by role/sub tier), and a max-pending-requests limit per role.

## Requests understand more than plain text

Viewers can paste a Spotify track link directly, or type `song title by artist` for the most reliable match. Both skip Spotify's fuzzy text search, which is what a plain `!sr` query falls back to.

## Auto-add to a playlist

The **Playlist** dropdown lists every playlist on the connected account automatically, plus a synthetic 💚 **Liked Songs** entry. Pick one and mods/broadcaster can run `!add` to add whatever's currently playing to it.

## Chat commands this unlocks

| COMMAND | WHO | WHAT IT DOES |
| --- | --- | --- |

| | | |
|---|---|---|
| `!sr <song>` | Configurable | Requests a song |
| `!remove` | Requester / Mod | Cancels a still-pending request |
| `!song` | Everyone | Shows what's currently playing |
| `!queue [N]` | Everyone | Shows upcoming songs |
| `!next` | Everyone | Shows just the next song |
| `!add` | Mod/Broadcaster | Adds the current song to your chosen playlist |
| `!skip` | Mod/Broadcaster | Skips the current song, promoting the next request first |

The **OBS Now Playing Overlay** subsection has its Browser Source URL and a **Card alignment** (Left/Center/Right) setting; see Section 5 for adding it to OBS.

SECTION 05 · OPTIONAL

# 📺 OBS Overlays

Three independent browser-source overlays, each opt-in: nothing happens unless you actually add its URL to OBS.

| OVERLAY | WHERE THE URL IS | WHAT IT SHOWS |
|---|---|---|
| **SFX** | Settings → SFX Browser Source URL | Plays every sound effect (custom commands, redeems) |
| **Now Playing** | Song Requests → OBS Now Playing Overlay | Album art, title, artist, progress bar |
| **Wordle** | Wordle → Browser Source URL | The live Wordle board |

## Adding one to OBS

1. Click the **Copy** button next to the overlay's URL.
2. In OBS: **Sources** → **+** → **Browser**, paste the URL.
3. Set a Width/Height that comfortably fits the content, then position it in your scene.

All three overlays push live updates: a freshly added or reconnected browser source shows the current state immediately instead of sitting blank until something changes.

> 💡 **If text looks soft/blurry:** set the Browser Source's Width/Height in OBS to *double* what you actually want on screen, then scale the source back down to 50% in your scene (drag a corner, or set Transform → Scale). This renders at higher pixel density and lets OBS downscale it, which is the standard fix for fine text looking fuzzy in a Browser Source.

For SFX specifically: drop `.mp3` / `.wav` / `.ogg` files into the app's `sfx` folder, or use the file picker when setting up a Custom Command or Redeem that plays a sound. Either way, they show up automatically, no need to touch the overlay itself.

SECTION 06 · OPTIONAL

# Wordle Game

A chat-driven Wordle round your viewers guess together, with its own leaderboard and OBS board.

## Settings

On the **Wordle** page: a start/stop chat command (defaults to `!sw`, mod/broadcaster-only), round duration in seconds (default 105), and the delay before the next round auto-starts after a win or timeout (default 10s).

## Commands

| COMMAND | WHO | WHAT IT DOES |
|---|---|---|
| `!sw` | Mod/Broadcaster | Turns the whole game on/off |
| `!pause` | Mod/Broadcaster | Pauses the current round's timer |
| `!play` / `!resume` | Mod/Broadcaster | Resumes a paused round |
| `!reset` / `!restart` | Mod/Broadcaster | Force-starts a new round |
| `!topwins` | Everyone | Shows the top 5 leaderboard |
| `!help` | Everyone | Explains how to play |

Every message above is individually editable from the **Commands** page.

## Coming from the old standalone Wordle app?

The **Leaderboard** tab has an **Import Legacy Leaderboard** button that pulls win counts from the old standalone game's save file and merges them in. It only ever raises a count, never lowers one, so it's safe to run more than once.

SECTION 07 · OPTIONAL

# Daily Check-In

A single channel-points redeem that awards a viewer points and replies to them, sent from **your own** Twitch account, not the bot's.

## Setup

1. Create the reward on Twitch first (or on this app's **Redeems** page).
2. On the **Daily Check In** page, enable it and pick that reward from the dropdown.
3. Set how many points a check-in is worth, and the two-line chat message that gets sent. Placeholders `{user}` and `{value}` are available in both lines.

> 💡 The confirmation is sent as your **streamer account**, not the bot, so it reads like you personally welcoming them. This needs your Streamer connection from Section 2 to have gone through cleanly.

The **Check-In Points** tab is a searchable, editable list of everyone's running total, the same numbers `!ssnacks` and `!topsnacks` read from in chat. A generic Redeem (Section 9) can also be set to award these points independently, if you want more than one way to earn them.

SECTION 08 · OPTIONAL

# Custom Commands

Build your own chat commands with no code, and edit the wording of the bot's built-in ones.

## Built-in commands

The **Commands** page lists everything the bot ships with. Anything with an **Edit messages** button lets you rewrite its exact chat replies. Most of the built-in commands support this.

## Making your own

Click **+ New Command** and fill in:

- **Trigger**: e.g. `!lurk`
- **Type**: *Reply* (one or more random variants, with placeholders like `{user}`, `{args}`, `{random:1-100}`, `{choice:a|b|c}`) or *Counter* (a per-command number that increments/decrements/displays, with a `{value}` placeholder)
- **Sound effect**: optional, pick a file and a volume
- **Who can use it**: Everyone, any sub tier, Moderator, or Broadcaster (broadcaster always passes regardless)
- **Cooldown**: none, global, or per-user, in seconds

SECTION 09 · OPTIONAL

# Channel Point Redeems

Create and manage Twitch channel-point rewards directly from the app, and wire them up to do something automatically.

Click **+ New Redeem** to set a title, cost, viewer-facing prompt, whether it needs text input, its color, and whether it's visible/instantly-fulfilled on Twitch. Then pick a **Bot Behavior**:

| ACTION | WHAT HAPPENS |
|---|---|
| Message | Bot replies in chat |
| Counter | Adjusts a named counter, same ones Custom Commands can read |
| Snack Check-in | Awards Daily Check-In points, same store as Section 7 |
| Sound Effect | Plays a sound on the SFX overlay |

Rewards that already existed on Twitch before you added them here can still have their bot behavior configured, even though their title/cost/prompt stay editable only on Twitch itself.

⚠️ Turning on **Skip Reward Queue** means Twitch auto-fulfills the redemption before the bot ever sees it, so anything this app would normally enforce (like a max-length check on a song request redeem) can't actually block it.

SECTION 10 · OPTIONAL

# Coin Toss

A fully automatic chat minigame: there's genuinely nothing to configure.

Every so often while you're live, a random viewer gets challenged in chat and has 30 seconds to reply `!coin heads` or `!coin tails` for a chance at points. It's entirely passive. The only control you have is:

| COMMAND | WHO | WHAT IT DOES |
| --- | --- | --- |
| `!p` | Mod/Broadcaster | Pauses or resumes the whole game |

💡 Points are awarded through an external `!givepoints`-style command. This assumes you already have a separate points/currency bot running (e.g. StreamElements) that owns that command.

SECTION 11

# Troubleshooting

The handful of mistakes that account for almost every "it's not working" report.

| SYMPTOM | LIKELY CAUSE |
|---|---|
| A Connect button hangs, or the browser tab shows an error | Redirect URI mismatch. Twitch uses `localhost:17846`, Spotify uses `127.0.0.1:17845`. Don't mix them up, and copy rather than retype. |
| Accounts are connected but nothing happens in chat | The bot itself was never started. Go press **Start Bot** on the Dashboard (Section 3); this is by far the most common one. |
| Everything worked yesterday, nothing works today | If the whole app restarted (update, reboot, closed and reopened), the bot needs to be started again manually. It doesn't resume on its own. |
| Spotify features suddenly return a permission/scope error | An app update may have added a new Spotify permission. Refreshing your existing connection can't grant a new scope. You need to fully reconnect Spotify (Section 4) again. |
| A channel-points reward isn't showing up in a dropdown | Make sure it actually exists on Twitch (or was created on the Redeems page) before trying to select it, then reopen the page so it re-fetches the list. |
| Something changed in Settings but doesn't seem to apply | Stop and Start the bot again from the Dashboard. Settings-page changes need a restart, and the app's own Save button there does this for you automatically. |

## Quick reference: ports & overlay URLs

| WHAT | VALUE |
|---|---|
| Twitch OAuth callback | `http://localhost:17846/callback` |
| Spotify OAuth callback | `http://127.0.0.1:17845/callback` |
| SFX overlay | Settings page |
| Now Playing overlay | Song Requests page |
| Wordle overlay | Wordle page |

Still stuck? Every field in this app has a short hint underneath it. When in doubt, that's the fastest source of truth, since it always matches whatever version you're actually running.
